GTM Materials: DamlLens

Acquisition channel	HackCanton S2 community, direct DMs, and Canton/Daml technical channels.
Activation hook	A 2-minute demo that shows why a workflow stopped, who can act, and what changed.
Retention driver	Users come back whenever they need to debug, explain, or review a workflow faster than using logs, JSON API, or code.

1. First 10 users

We get the first 10 manually from places where Daml/Canton builders already are.

- Targets: HackCanton S2 participants, Daml application engineers, Canton platform/integration engineers, builders asking technical questions, and people posting about Canton/Daml on X or LinkedIn.

- DM 20-30 HackCanton builders with: "Can I show you a 2-minute demo for understanding Daml workflow state and permissions?"

- Post short demo clips in HackCanton community channels and ask for feedback.

- Reply to Canton/Daml technical threads with useful workflow-debugging insight, then invite people to try the demo.

- Ask workshop hosts, mentors, or AppsFactory team members to point us to builders working on multi-party workflows.

- Offer to map one real workflow from a team project into DamlLens as a free feedback session.

Goal: get 10 builders to try the demo and give feedback, not just express interest.

2. First 100 users

What scales from the first 10 is the workflow walkthrough: repeatable examples that show DamlLens making a workflow easier to understand.

- Create before/after workflow debugging clips.

- Post short examples showing active vs archived contracts, stopped workflows, and party-permission relationships.

- Publish example maps for invoice financing, collateral settlement, and approval workflows.

- Share templates for common Daml workflows and a public demo link with sample workflows.

- Post community updates after each improvement, tied to user feedback.

- Distribute through HackCanton, Canton/Daml developer channels, X/LinkedIn, GitHub README/demo repo, ecosystem partner intros, workshops, and office hours.

Goal: get 100 builders/operators to open the demo, with at least 20 completing the sample workflow inspection task.

3. Growth lever

The main growth lever is community-led developer distribution through shareable workflow maps.

- Every useful output should be shareable: workflow timeline, party-permission map, stuck workflow explanation, or demo/debug report.

- When one engineer uses DamlLens to explain a workflow to teammates, judges, mentors, or operators, the artifact naturally exposes the tool to more people.

Growth loop: builder imports or simulates workflow -> DamlLens generates readable workflow map -> builder shares it in demo/review/debugging -> other Daml/Canton builders see the value -> they try it on their own workflow.
